Chatbots:

Chatbots are software that use AI integration to interact and converse with various users using a program. We can use a chatbot to help improve the user experience. The content we have on the web page will help provide information to the customers. However, some specific/niche questions may not be answered fully by this content. Therefore, it could be worth implementing a chatbot with extensive knowledge on this. That way the users can ask the chatbot any questions that they can't find an answer to. This could help make sure people have the correct information to help them decide if a t level is for them.

Our ai chatbot currently isn't of much use, however it still provides a response, to show the core idea and concept behind it. We didn't think to fully develop an ai chatbot for out site as it would be way out of scope for us, as it would be too difficult and expensive to implement.
