

Evaluation

Over the course of the project I think we did overall a pretty good job, however there are things that we could have improved upon with more time. In conclusion though, we did manage to complete all necessary things, some of which to a very good standard, and other bits to an ok standard. Overall, I think given the time frame our product is good.

Improvements

Our research document ended up being very confusing and slightly less helpful than it could have been, if we spent more time organising it into a reasonable way. The document would have looked much better and been significantly more useful.

Our proposal could have also done with having a bit more time invested into it, as it did not feel completed to the standard we would have liked. However, we did go back over it later and add some improvements.

Our website does not look amazing when significantly zoomed in, this would ideally not be the case, however given the limited programming knowledge our team had when starting the project, we did not know the ideal way to design it to avoid this. If given more time maybe we could improve upon this.

Although the database interactions should be secure with how we programmed it, I think there is still room for more validation to make it even harder for any systems to be accessed or messed with by people without access. I also think some database values were set to be strings to be easier, when they would ideally be stored as another data type.

Our design document did contain all necessary things; however, I think some parts could still be improved. For example, we didn't make flow charts for all the algorithms we used.

Successes

Throughout the entire development of the project, we managed to keep the front end of the web page very similar to our final design.

All the features that we decided we wanted to implement into the project, we managed to find time to implement them.
