Introduction

The business context

Which areas are we working with (business admin, media broadcast and production, digital (tech support, software development, data), finance.)

Amazon is a global tech giant; it leads many innovations in technology. They have different parts of the business, such as Amazon Video, Shopping, Alexa, **AWS**, prime, Audible, Luna, Kindle and Amazon Music.

AWS provides a vast number of on demand services such as computing power, and databases, allowing businesses to scale and manage their IT resources efficiently. AWS also has the most extensive global cloud infrastructure, with multiple regions and availability zones worldwide. This infrastructure ensures high availability and reliability for applications running on AWS, and it basically upholds the entirety of the internet.

They have about close to just 1.58 million employees and have been pushing towards more automation and even AI in their warehouses and business to plan out their business and work schedule development, more efficient for their workers to make more profit through saving some time and money. For the T Level placement, Amazon has also been offering an apprenticeship for a student if they've shown many good working qualifications and skills and so they can add onto work experience for younger people of that skill set in the future.

Specifically, we will be working with the business admin team, finance team, media and broadcast, and mostly the digital team. The digital teams consist of the tech support team, software development and the data teams. The software development teams will help in development of the product, whereas the data teams will analyse metrics about the site and the impacts it is having.

What are they looking for?

Problem overview

Type a paragraph about what the problem is, not how to solve, just the problem.

Not recruiting youth talent, they need to do this.

Amazon is a major global technology company, but their current approach to attracting and developing youth talent has several weaknesses that affect the business. At the moment, Amazon doesn't have strong digital spaces aimed specifically at young people, such as dedicated social media channels or online platforms that clearly explain their early career opportunities. Because of this, many students who might be interested in digital careers at Amazon are not aware of what roles exist or how to get involved. This limits the number of young people entering Amazon's talent pipeline.

Limited Visibility and Engagement

The lack of accessible digital recruitment channels means Amazon is not reaching young people where they spend most of their time online. Without clear, engaging information, students struggle to understand what Amazon offers, what skills they need, or what the career path looks like. This reduces interest and leads to fewer applications from motivated young candidates.

Dependence on External Hiring

Since Amazon doesn't have a strong flow of junior developers or apprentices progressing through the company, they rely heavily on external recruitment when senior staff leave. External hires require significant time and money to train on Amazon's internal systems, tools, and processes. This slows down productivity, increases onboarding costs, and creates delays in technical teams when experienced employees move on.

Weak Internal Progression Pipeline

Without a consistent youth talent pipeline, Amazon lacks employees who have developed within the organisation and already understand its culture and systems. When senior developers retire or leave, there are fewer internal candidates ready to step into those roles. This creates skill gaps, reduces continuity, and can impact long term project stability.

Information Not Easily Accessible to Students

Young people who might want to join Amazon's programmes often do not receive clear or simple information about what the roles involve. If the information is hard to find or too complex, students may feel unsure about whether Amazon is the right career path for them. This uncertainty reduces engagement and limits Amazon's ability to attract new talent.

Scope

The potential scope of solving Amazon's youth-talent engagement problem is massive, covering requirement platforms, social media promotions, communication tools and back-end data systems. This is far too big of a project for our 3 week placement. To keep the project focused and manageable, we are limiting the scope to a single, clear, objective: creating a youth-friendly website informal website that explains amazon's early-career digital opportunities to students aged 16-19. This narrower scope avoids complex requirement features and instead focuses on delivering accessible, engaging information that helps young people understand Amazon's roles, skills requirements, and pathways. By doing this, the project remains achievable while still addressing the core visibility and engagement issues identified in the problem overview.

User groups

Youth talent (t level students), Careers advisor, Amazon (emerging talent team)

T level students would seek to stay connectable work experience that would provide easily transferable skills in their qualification for future employment and likely to get hired more. If they were to do particularly well then they could also get an apprenticeship from Amazon once they leave college.

Amazon themselves could also benefit from this as the feeling, gain new future youth talent and not older workers or software developers or programmers who are likely to eventually retire and leave them with less of a technical workforce.

With career advisors they could keep in touch between broadcast students and Amazon through social media such as Instagram and their college emails to keep them in touch more easily.

User Stories

Take each user group and say what they are thinking, feeling and wanting from the program. User requirements will come from this.

The youth talents

- The youth talents could get an amazon program of some sort as amazon are big of enough size to be able to provide that for the community
- They can also provide more entry level opportunities for the youth, to help build a stronger workforce generation
- The youth also desire faster load times for the digital services

Educational staff

- If amazon provides the programs, then the education staff will be happy that their students can find information
- However, they may worry about career progression within the students

Amazon team

- The staff may first be cautious depending on their first impression of the colleges the students will be in

Empathy Maps

Explore in depth what people are going to think and do. Generates user requirements.

Youth talent

Says - where are the applications -where is the information about apprenticeships - what careers do this company offer - where is the information on their t level program - where does your courses lead to	Thinks - I hope this company have a post 18 program -will their course be good enough - will they help me pass the t level course -wants to do apprenticeship
Does - check for information -looks at websites - tries to sign up for any courses - calling help team - applies for post 18 apprenticeships	Feels - upset there's no amazon program -unsure as to how to get a career started - annoyed at loading times - frustrated with not finding the information they need

Educational staff

Says - can our students/people sign up for the various programs -can our students access the correct information	Thinks - will they be able to achieve the requirements of these courses -I want to figure out their progression routes with courses - I want to know what t level placements they have - Amazon being a big company surely, they have t level courses
Does - check to see if there are courses -advice students on various opportunities on placements - helps students apply for after t level courses	Feels - hopeful their students can find information -concerned about whether students can progress at Amazon - worried about students' access to information and guidance for post 18 education/work

Amazon team

Says - What certain skills for tasks can you do on the solution - After careful consideration, we've found our best suiting student qualified for our apprenticeship	Thinks - Hoping that not only they'll give one an apprenticeship but can find other potential future employees for the digital workforce in the other students in the youth talent group
Does - Holding an online meeting with students from other colleges for introductions and what project they'll be working on	Feels - At first cautious depending on their first impression of the colleges the students will be in

Risks - Mitigation

Too big a scope - Plan what we think the team can achieve in the time limit, and work to try and achieve that before anything else.

Too little ability in the team - Assign team members to tasks they are best at so that the overall skill is used as best as possible.

Overreliance on ai - Avoid using AI in ways more than simply for ideas or slight help

Not competent enough - Assign someone to go and help the member who is currently stuck and guide them through what they're supposed to do until they know and let them do it themselves

Security Risks – Ensure security is thoroughly considered when planning and implementing new features and make sure it is dealt with if it is a reasonable issue to solve in the time limit. For example, considering how to limit the number of times unencrypted data is either sent over web requests or stored on the user's computer.

Laws/legislation/regulations

GDPR

It affects the project as we must consider the risks of the data we are collecting, for example making sure the data will be safe and that we can only hold the data for however the data is necessary. The project will be designed around the safety and holding of the data we have collected.

WCAG

The project should be designed to follow standards such as alt text for images. It should also be layed out in the code in a reasonable way as well as on the screen. That way any narrator tools can make sense of the site, rather than just the human eye.

Alternative Solutions

Which competitors have a similar thing, what is good about it and what could be improved.

Minimum of 3.

What will you steal/take inspiration from their products to put into amazon product.

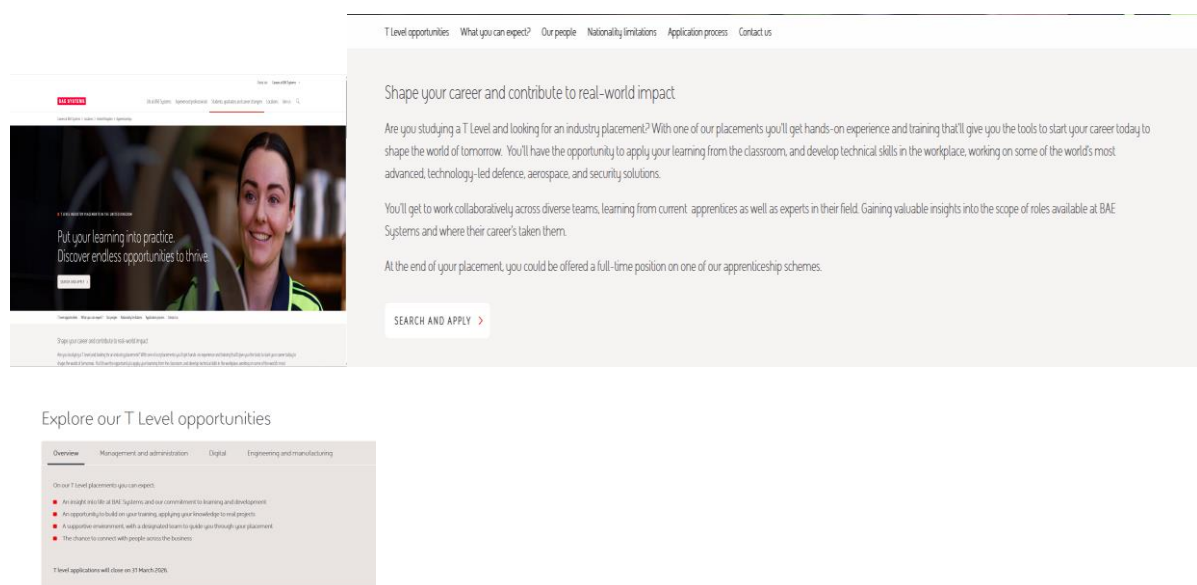

<https://careers.baesystems.com/locations/uk/apprentices/tlevels>

BAE Systems

Good – Has tabs letting you click through info of the separate t levels. Well organised information can easily find what you're looking for. Not cluttered, readable.

Bad – Limited information, no social features, can't share specific bits.

Take inspiration – Put info into short sentences and bullet points, rather than overcluttered paragraphs.

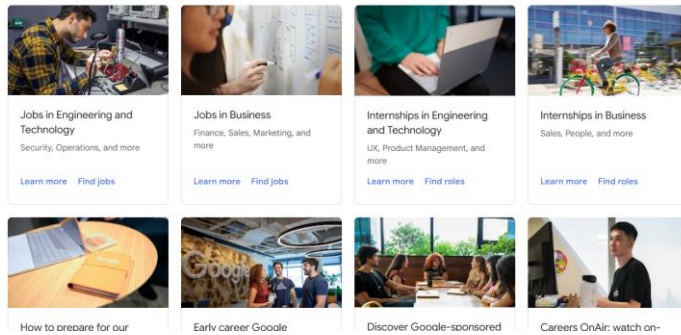

Google

<https://www.google.com/about/careers/applications/students/>

Good – Has external resources (e.g. [YouTube](#) links), has links to their social medias. Allows you to share links to specific info since its all spread out onto separate web pages. It also gives you tons of information about how to apply for the jobs and what qualifications you will need for the job.

Bad – Information isn't all in one place. The information is all on separate pages that you must go to. Lack of information overall. It can be confusing how to find the pages with the information the whole website looks simply but can be a bit clunky.

Students

Roles

Software Engineer

Your work is at the core of everything we build. Develop massive, complex software systems that scale globally.

Network Engineer

Design and implement enterprise and carrier network systems and architecture vital to Google's operations.

Research Scientist

You move beyond the lab, working closely with Software Engineers and others to discover, invent, and build at the largest scale.

Product Manager

Architect the future of our products by bridging engineering and business as you manage a product's full lifecycle, from strategic planning to development and launch.

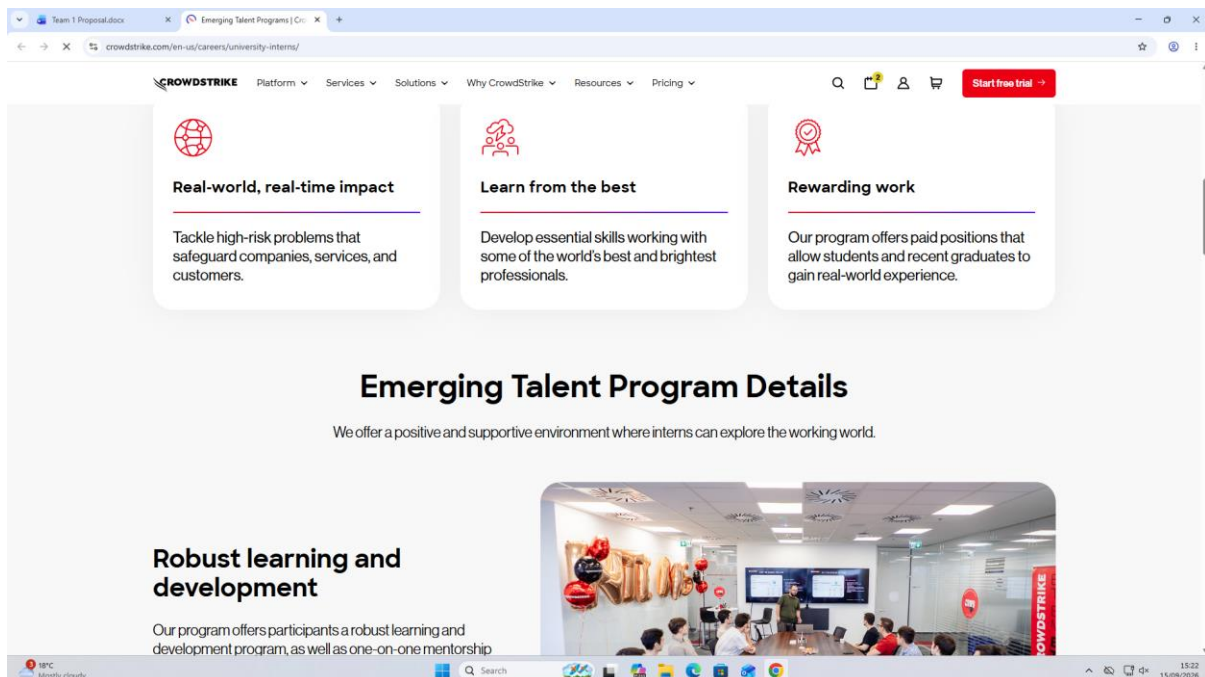

Technical Program Manager

Rely on your strong technical experience to oversee all the essential activities of a particular program, including planning, communications, and execution.

Security/Privacy Engineer

Hack Google... if you can. Work on finding security flaws, building secure infrastructure, or ensuring data privacy as part of a diverse engineering team.

<https://www.crowdstrike.com/en-us/careers/university-interns/>

Good – really nice layout, good titles to show you where the information is. Has obvious links to external. Drop downs to show more info.

Bad - Top of the page full of images and achievements, which isn't providing info.

Take inspiration – Appealing layouts, and has extra info in dropdowns

The functional requirements

What the website should do for users, allow connect with amazon, social features, register details to allow amazon to stay connected with you.

Functional requirements – allow users to register, once logged in direct users straight to their profile page

The program should allow users to sign up and login to accounts.

It should allow users to enter an email to "sign up" to a newsletter.

Once logged in it should allow them to download user only accessible info.

It should display all the useful info in a convenient way for users.

It should be designed correctly, to work with narrator tools and be zoomed for people with bad eyesight.

Have social features to allow users to share links to specific sections of the webpage with info on them.

Non-functional requirements of the solution

How to implement the user requirements in code. For example, a well secured database, storing minimum required amount of data.

Decomposition of the problems that will need to be solved to implement the functional and non-functional requirements

Securely usage/storage of data – Really secure data such as passwords should not be sent back to the user's device as this would significantly increase security risks. They can be sent to the server in an unencrypted format, as https requests will auto encrypt everything in them. Once it is on the server it should be hashed before being stored, that way the original password is inaccessible, even if the server is breached. Then when checking for login the password should be hashed user side to avoid sending it over the internet in a less secure way, the hashes can then be compared.

Minimum data storage – only store the data that you are sure will be reused in the future.

Accessibility – design the webpage in a way that will remain properly viewable when zoomed in, allowing for it to be a good experience for people with worse eyesight. Also make sure that images have appropriate alt text to describe images to narrators.

Display info conveniently – set up a div class that can be reused and have a similar design with some changes, this way it all matches and can be made obvious where the different sections are.

Key performance indicators (KPIs)

What is amazon going to be looking for from this website, minimum views per month, signups per day. What metrics can they look at and use as comparisons/

Page load time – will want a sub second load time to avoid the user clicking off and going somewhere else.

Track daily views – this allows for amazon to track how many people are interested in this, that way they can use it as a way to get an idea of interest in the program, and how many people visited the website but didn't sign up.

Sign up numbers – track how many people sign up. This shows amazon how many people are specifically interested in the amazon T Level info.

User loyalty – This allows amazon to track the number of times each user revisits the site and what pages they will be revisiting

User engagement - this will show the amount of time the user spends on the website. This will help amazon see how people interact with the website

User Acceptance criteria

What things should it have to make customers/users happy with the site.

Conveniently accessible information

Social functions – share button on different sections of the site to auto redirect users to that section with the link

Nice navigation bar – obvious and easy to navigate nav bar

Convenient layout – have everything where the user would expect to find it

Sign up and login function – have a sign up and login function that is not overcomplicated, have a sign out option, and a remember me option.

Newsletter signup – have a nice separate div that simply has a title, email input and a signup to newsletter button.

Do not put too much info on one page – if wanting to put a lot on 1 page use boxes that may be hidden until expanded, as too much on one page can make it complex to navigate

Description of the proposed solution (NOT A DESIGN)

Describe the functions of what we THINK we will build, not a design yet.

Not the design yet

Inclusive Solution – The solution will be developed to facilitate easy use for people with accessibility needs. This way all potential users can get the best experience possible, and that way will be able to decide if they want to join the program, rather than just not be able to find out about it.

Social functions – The solution will include features such as share buttons. This allows for pieces of content on the site to be easily shared with friends, or onto social media platforms. Therefore, the information will be spread to more people, increasing the reach of the program.

Info blocks – The solution will have the information spread out into paragraph sized blocks of information, probably each with a title and image alongside it. This makes it easy to locate the information the user is looking for and also facilitates the share function.

Newsletter – The solution should have an easy email signup for users to sign up for the newsletter. The newsletter will not actually be functional; however, it will take user info and add it to the database.

Downloadable material – the solution should have some downloadable material, so that it can be viewed later offline.

Accounts – The solution will have a properly designed sign up and log in system. This will allow for there to be web pages that only people with accounts can access. This means that they can prevent all people from accessing some more private info, that they may not want to be publicly available.

Decomposition – breaking down the problem into a diagram

User acceptance criteria – the list of things that the user will need to see or experience or feel to accept the system, such as a nav bar being obvious, fast times and that or clear instructions
